

## **Reservoir Installation Instructions**

1. Start by deciding where you would like to place your fountain, making sure there is sufficient space to dig at that location. Clear and mark the dig location accordingly depending on the size of the reservoir kit. 2x2 Kit - 27", 3x3 Kit - 39", 4x4 Kit - 51".

2. Dig approximately 11" in the previously marked location, making sure it is fairly level at the bottom of the hole.

3. Place a thin layer of sand in the bottom of the hole to help level the reservoir and bring the final depth of the hole to 10 inches. This will place the top lip of the reservoir just above the level of the ground (this will ensure no dirt gets into the reservoir during regular use).

4. Place the reservoir into the hole ensuring it is level. use some of the removed dirt to fill in the empty space around the reservoir.

-Note: A slight warp in the bottom of the reservoir tub is normal and will level out as the weight of the fountain is placed on it.

-Make sure enough 8" cinder blocks are used inside the reservoir to ensure a stable base for the fountain.

- We recommend the use of 8"x8"x8" cinder blocks.
- Use: 2-3 blocks for a 2x2, 3-4 blocks for a 3x3, and 4-6 blocks for a 4x4.
